ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE FORMATION OF DIFFUSION COATINGS ON METALS FROM THE GAS PHASE CONTG. H HALIDES CAN OCCUR BY ANY OF SEVERAL DIFFERENT REACTIONS. THE CASE OF SATN. OF THE SURFACE OF METAL M SUBALPHA WITH METAL M SUBE, WITH THE FORMATION OF A SOLID SOLN. DURING SIMULTANEOUS PROCEEDING OF THE EXCHANGE AND THE H REDN. REACTIONS IS EXAMD. THE EXCHANGE FACTOR, ALPHA, DEPENDS ON CONCN., N SUB1, OF THE METAL SATURATOR M SUBE IN THE SOLID SOLN. WITH THE SATURABLE METAL M SUBALPHA, THE THERMODYNAMIC ACTIVITY OF M SUBE AND M SUBALPHA, AND THE CONSTS. OF THE EQUIL. EXCHANGE AND HYDROGEN REDN. REACTIONS. ALSO, WITH INCREASING N SUB1, THE ALPHA DECREASES AT POS. DEVIATIONS FROM RAULT'S LAW, AND, VICE VERSA, IT INCREASES AT NEG. DEVIATIONS. THE 3 POSSIBLE CASES OF THE DEPENDENCE OF ALPHA ON N SUB1 DURING THE FORMATION OF IDEAL SOLNS. ARE DISCUSSED. THE EFFECT OF THE H SUB2 CONTENT IN THE STARTING GAS MIXT. ON ALPHA DEPENDS ON THE RELATIVE MAGNITUDE OF THE ISOBARIC POTENTIAL OF THE INTERACTION REACTION BETWEEN M SUB2 AND M SUBSLPHA AND THE H HALIDE. CONSEQUENTLY, IF K SUB1 LARGER THAN K SUB2, THEN ALPHA INCREASES WITH INCREASED INITIAL H CONCN., AND IT DECREASES IF K SUB1 SMALLER THAN K SUB2. WITH INCREASING K SUB1 AND CONST. K SUB2 THE ALPHA INCREASES. IF, HOWEVER, K SUB2 INCREASES AND K SUB1 REMAINS CONST., THEN ALPHA DECREASES. EXPTL. DATA CORRESPOND TO THE LAWS DERIVED IN THIS WORK.

"Study of Gas Flow upon Dynamic Loading of Liquid Nitrogen and Hydrogen"

Dinamika Splosh. Sredy [Continuous Medium Dynamics -- Collection of Works], No 10, Novosibirsk, 1972, pp 233-238 (Translated from Referativnyy Zhurnal Mekhanika, No 12, 1972, Abstract No 12B202, by O. K. Rozanov)

Translation: The peculiarities of the flow of liquid nitrogen and hydrogen resulting from the action of dynamic loading of high intensity on the liquids are studied experimentally. Two methods of loading of deliquified gasses are used: planar loading of a layer by the impact of a plate accelerated to high velocity by detonation products, and cylindrical compression of an ampule containing the cryogenic liquid. The experimental installations are described in detail. The nature of flow of the liquids, differing significantly in molecular weight, compressibility and density, was analyzed in glass pipes 10-12 mm in diameter attached to the unloaded side of the liquid through a thin diaphragm. The air pressure in the pipe was 0.5-1 mm hg. In the case of hydrogen, a pipe of stainless steel 100 mm long was connected to the dia-

phragm, followed by the glass pipe. The waves propagating in the pipes were recorded by a streak camera.

With planar loading, it was found that the maximum shock wave velocities in

the pipe occur for nitrogen when the working chamber, with a volume of 2-3 cm³, was shaped like a truncated cone with a peak angle of 90°. It is demonstrated that the influence of rear loading on velocity is slight, while variation of the cone angle has a significant influence on flow velocity, which is related to the effect of reflection from the side walls of the cone. It is noted that the exhaust velocity remains practically unchanged over the first 300 mm from the diaphragm. With planar loading of the hydrogen layer, the velocity in the initial sector reaches 35 km/sec, at a distance of 1 m it drops to 23 km/sec. The flow arising in this case is characteristically unstable. Cylindrical compression of the ampule of nitrogen formed a Mach configuration. In the case of hydrogen, pulsed x-ray studies showed complete closure of the ampule. It is emphasized that cylindrical loading produces no increase in flow velocity over flat loading for 150-300 mm. "Use of Cumulative Explosive Charges in MHD Pulse Generators"

V sb. Dinamika sploshn. sredy. Vyp. 3 (Dynamics of a Continuous Medium--collection of works. No 3), Novosibirsk, 1969, pp 111-114 (from RZh-Mekhanika, No 9, Sep 70, Abstract No 9B47)

Translation: The authors investigate the possibility of using gas-cumulative explosive charges in MHD generators, where the charges create a jet of detonation products 10-15 times as long as the discharge channel is wide. An induced voltage of 50 V/cm was produced with a jet velocity of 10^6 cm/s and a magnetic field of 0.5 T. The resistance of the cumulative jet was measured by the electrode method. For a cylindrical charge with an aluminum casing having an inner channel wall thickness of 0.15 mm, an electrical conductance of about 100 mhos/cm was obtained. A power of 1.2 MW was obtained with a 1 sq. cm channel cross section. Magnetic pulse fields of up to 10 T were also used. Bibliography of four titles. Yu. N. Denisov.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE PAPER DEPICTS THE RESULTS OF SURGICAL TREATMENT OF 629 PATIENTS WITH DIFFUSE TOXIC GOITER PREDOMINANTLY OF MODERATE AND SEVERE FORM. PREOPERATIVE PREPARATION CONSISTED IN A COMPLEX OF THERAPEUTIC AND TONIC MEASURES. AS ANTITHYROID AGENTS OVER 95 PER CENT OF PATIENTS RECEIVED MICRODOSES OF IODINE, DIIODOTHYROSINE AND PREPARATIONS OF THE ADRENAL CORTEX. THYROSTATIC AGENTS WERE EMPLOYED IN LESS THAN 5 PER CENT OF CASES. SUBTOTAL RESECTION OF THE THYROID GLAND WITHOUT LIGATION OF VESSELS WAS CARRIED OUT UNDER ENDOTRACHEAL ANESTHESIA AFTER A. V. VISHNEVSKY AND IN CHILDREN SOMETIMES UNDER ENDOTRACHEAL ANESTHESIA. RATIONAL PREOPERATIVE PREPARATION OF PATIENTS WITH TOXIC GOITER IS A RELIABLE MEANS OF PROPHYLAXIS OF POSTOPERATIVE COMPLICATIONS; PREVENTS THYROTOXIC CRISES WHICH, AS A RULE, DETERIORATE THE CONDITIONS OF OPERATIVE INTERVENTION. A LETHAL OUTCOME AFTER THE OPERATION IN A 6 YEAR OLD GIRL WITH SEVERE THYROTOXICOSIS AND HYPOCORTICISM WAS DUE TO THE LATE EFFECT OF REANIMATION IN AN INCORRECT CHOICE OF THE METHOD OF ANESTHESIA. THIS COMPRIMES 0.1 PER CENT TO THE TOTAL NUMBER OF OPERATIONS FOR DIFFUSE TOXIC GOITER (930) PERFORMED DURING 1962 TO 1966.

"A Method of Determining the Statistical Characteristics of Search Time"
Moscow, Radiotekhnika i Elektronika, Vol. 16, No 6, Jun 71, pp 1068-1071

Abstract: A method is described for determining the moments of probability distribution of search time. The procedure is based on representing the search time in the form of a sum of a random number of random quantities with the use of generating functions. The working range of the possible values of the parameter to be evaluated is broken down into elementary cells, one of which contains the signal. It is assumed that there is a total of n_0 elementary cells. The elementary cells are examined in sequence in accordance with the accepted search algorithm. If there is no signal in a given elementary cell, search continues. If there is a signal in the cell, search is terminated. Erroneous decisions may result from noises. There is a false stop if it is decided that there is a signal where in fact there is none. It is assumed that in this case, the system detects its own error in a given time sufficient to guarantee the predetermined reliability. If it is decided that there is no signal in a cell which in fact contains a signal, the system begins a new search cycle. It is assumed that the probability of a false stop α and false signal skip β

remain constant during search, and that the results of analysis of individual cells are independent. It is found that the mean duration of a regular search is less than the mean duration of a random search by a factor of $2/(1 + \beta)$. It was also found that the time variance of a regular search is less than for a random search. In fact, the second term in the expression for time variance for a regular search is less than for a random search by a factor of $2/(1 + \beta)$ and the first term for large m_0 is less by a factor of $\frac{1}{\beta + (1-\beta)^2}$ than for random search. The difference between them decreases with an increase in the probability of skip.

"Investigation of the Properties of an Oxide Film Obtained by Atomic Oxygen
Ion Bombardment of Silicon and Use of Such a Film for Protecting a PN
Junction"

Moscow, Radiotekhnika i Elektronika, Vol 16, No 8, Aug 71, pp 1462-1467

Abstract: The paper presents the results of a study of the thickness of oxide films as a function of the conditions of silicon bombardment by atomic oxygen ions, as well as the composition and dielectric properties of the films and the space charge in them. The protective properties of oxide on structures with ion-injected PN junctions are studied. Most of the experiments were done on N-type and P-type silicon with resistivity of 7-10 $\Omega \cdot \text{cm}$. The specimens were irradiated in the chamber of the ILU-2 ion accelerator. It was found that the thickness of the oxide film increases in proportion with the energy of the ions and decreases as the ion current density increases. The dielectric strength of the insulating layer was $(3-10) \cdot 10^6 \text{ V/cm}$. It is shown that the composition of the film depends on subsequent annealing.

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 8, Aug 73, pp 1686-1691

Abstract: Reaction of N,N-bis-aren(alkane)sulfonyl-1,4-quinonediimines (I) with dialkyl phosphites leads to the formation of dialkyl (N-4-arensulfone-amidophenyl-N-arensulfonyl)amidophosphates. The structures of these products were proposed on the basis of IR and PMR spectra as well as from the number of labile hydrogens. It was established that along with the phosphorylation of (I) there occurs a competing oxidation-reduction process, which is possible because of higher redox potentials of quinonediimines in comparison to quinone-monoimines. The ability of the dialkyl phosphites to react via the phosphorylation reaction increases in the following order: $(MeO)_2POH < (EtO)_2POH < (BuO_2)POH$.

"Reaction of N-arenesulfonylnaphthoquinonimines with Pyridine"

Khim tekhnologiya. Resp. mezhved. nauchno-tekhn. sb. (Chemical Technology: Republican Inter-Higher Educational Institutional Scientific-Technical Collection of Works), 1968, No 14, pp 43-47 (from RZh-Khimiya, No 1(I), 10 Jan 70, Abstract No 1 Zh 428)

Translation: A new reaction of N-arenesulfonylnaphthoquinonimines-1,4 with pyridine, forming a compound (I, R = Ph or n-tolyl), was described. A study was made of properties and the infrared spectra of I. A colored

reaction with primary amines was proposed. 0.01 Mole of N-(n-tolylsulfonyl)-naphthoquinonimine-1,4 was dissolved in 50 ml of pyridine; 50 ml of water was added for dilution at 20°; the mixture was stirred for 30 minutes; it was then poured into 500 ml of water; the resulting solution was filtered; the precipitate was washed with water and ether; dried at 40-50°; dissolved in heated 15% HCl; and

"Codoscope Type Cathode Ray Tube"

Moscow, Otkrytiya, Izobreteniya, Promyshlennye Obraztsvy, Tovarnyye Znaki, No 16,
8 May 70, p 57, Patent No 270102, Filed 20 Dec 67

Translation: This Author's Certificate introduces a codoscope type cathode ray tube containing recording and reproducing projectors, address plates, a control assembly, a potential carrier assembly and a luminescent output screen. The tube is distinguished by the fact that in order to insure high speed of recording the parallel binary code and to decrease the amplitude of the control signals, the control assembly comprises a system of parallel deflecting plates separated by dielectric and arranged perpendicular to the plane of the beam in direct proximity to the potential carrier.

"Depth of Penetration of Nonisothermal, Transverse, Individual Stream into a Channel with Constriction"

Tr. Mosk. Aviats. In-ta [Works of Moscow Institute of Aviation], 1972, No 248, pp 101-111 (Translated from Referativnyy Zhurnal Mekhanika, No 5, 1973, Abstract No 5B350, by I. M. Baskin).

Translation: Results are presented from experimental studies of an individual stream in a rectangular channel with a constriction, a model of a section of a circular combustion chamber of a gas turbine engine with a large radius of curvature. The studies were performed in order to determine the regularities of development of transverse streams in a moving stream with high temperature in channels with various constrictions. The model chamber has a square cross section of measurements are described. The model chamber has a square cross section with sides of 200 mm. The air was divided into the primary air supply for creation of the stream in the model chamber and the secondary air supply for creation of streams flowing from a side chamber, moving perpendicularly to the main stream. It is concluded that as the side stream flows into a

limited channel of variable cross section, the relative depth of penetration decreases with increasing constriction of the output cross section, if the distance from the mouth of the stream to the beginning of the constriction is less than the diameter of the chamber. It is demonstrated that a change in initial nonisothermal conditions of the mixing streams has no significant influence at the exit from the combustion chamber on relative depth of penetration and its decrease with increasing constriction. 7 biblio. refs.

"A Charge for Growing Ferrite Single Crystals"

+
USSR Author's Certificate No 253953, filed 4 May 67, published 30 Apr 70
(from RZh-Radiotekhnika, No 12, Dec 70, Abstract No 12V422 P)

Translation: This Author's Certificate introduces a charge composition which makes it possible to increase the saturation induction of ferrites (90.5 T) while retaining a narrow ferromagnetic resonance line. The charge consists of higher oxides of iron, zinc, lead and boron (13.3-16.0, 0.3-1.8, 68.1-68.7 and 10.4-11.0 wt.% respectively), and Li_2CO_3 . Heat treatment conditions are described. Also covered by the patent is a charge composition for making ferrites with a saturation induction of up to 0.44 T; a distinguishing feature of this composition is the substitution of gallium oxide for zinc oxide. The proportions by weight are also changed. N. S.

"Study of the Solubility of Lithium, Nickel, and Magnesium Ferrites in
 $PbO-B_2O_3$ "

Moscow, Kristallografiya, Vol 15, No 5, Sep-Oct 70, pp 1094-1096

Abstract: A study was made of the temperature dependence of the solubility of lithium, nickel, and magnesium ferrites in the solvent $PbO-B_2O_3$. The solubility data were obtained by determining the solution saturation temperature on the basis of growth -- the dissolution of seeds from the crystallized materials. A somewhat smoothed bend of the solubility curve was found in the $1000^{\circ} C$ region for lithium ferrite and the $1200^{\circ} C$ region for nickel ferrite, most clearly expressed on the plot by the derivative $\partial c/\partial T = f(T)$.

"Development of the Vestibular Apparatus (Labyrinth) of the Frog *Rana temporaria* in Weightlessness"

Leningrad, Zhurnal Evolyutsionnoy Biokhimii i Fiziologii, Vol 8, No 3,
May/Jun 72, pp 343-350

Abstract: To study the effect of weightlessness on development of vertebrate vestibular apparatus, 43-hour artificially fertilized *Rana temporaria* eggs were subjected to a 40-hour flight in the Soyuz-10, after which they were fixed and observed with an electron microscope. Embryos in the early gastrula stage were used to ensure that takeoff acceleration was experienced prior to establishment of definitive vestibular apparatus, in light of evidence that acceleration does have considerable impact on receptor cell development at the later stages. Normal development proceeded to the tail bud stage during 1/2

USSR

VINNIKOV, Ya. A., et al., Zhurnal Evolyutsionnoy Biokhimii i Fiziologii, Vol 8, No 3, May/Jun 72, pp 343-350

the flight, as it did in control embryos, and no differences were detected in development of the presumptive otocysts and the eighth ganglion. Morphology is described in detail, the main feature being the beginning of differentiation of receptor and support cells in the presumptive otocysts and of bipolar neuroblasts in the eighth ganglion. Thus weightlessness has no effect on development in general and on differentiation of the future vestibular apparatus in frog embryos.

"A New Herbicide Called Isophos"

Moscow, Agrokhimiya, No 1, 1972, pp 96-103

Abstract: Herbicidal properties of isophos-1, $\text{ClCH}_2\text{P}(\text{NH}_3^+)(\text{OC}_6\text{H}_3\text{Cl}_2^-)^2$, and

isophos-2, $\text{ClCH}_2\text{P}(\text{NH}_3^+)(\text{OCOH}_3\text{Cl}_2^-)^2$, were tested on many plants, including
 cocksbur grass (*Echinochloa crus-galli*), and rice grass (*Echinochloa oryzicola*),
 the weeds which commonly grow with rice. Application of 2-6 kg isophos-1 or
 isophos-2/ha killed 100% of the above weeds. The best time for application of
 the herbicides was before sowing of rice, or prior to its sprouting. A surface
 application produced the best results. Both types of isophos in 4-8 kg/ha
 doses were toxic to garden orache, amaranth, and white bent. Field pennycress,
 spring wild oat, and knotweed were of average sensitivity toward isophos.

1/2

GRAPOV, A. F., et al., Agrokhimiya, No 1, 1972, pp 96-103

Among the cultivated plants, rice was most resistant toward this herbicide, followed by wheat, oats, and barley (most sensitive). Cotton, beans, radishes, and sunflowers are resistant to isophos, but sugar beets and flax are sensitive. Carrots were most resistant to isophos in doses of 1-4 kg/ha and tomatoes and cucumbers showed medium resistance. Isophos was 100% effective against rice grass in meadow-marshy, soddy-podzolic, and sierozem soils. It was only 83-97% effective in soils with high humus content. Effectiveness of isophos lasted for 30-100 days after application. Analysis of the soil horizons indicated that it remained mainly in the top 0-10 cm of soil. The structure of the aryl radical determines the phytotoxic properties of amides of thio- and dithiophosphonic acids. Presence of two Cl atoms in the phenyl group increases the herbicidal effects of these compounds.

"Amino Acids as the Only Source of Nitrogen for Toxin-Forming Fungi"
Kiev, Mikrobiologicheskiy Zhurnal, Vol 33, No 2, Mar/Apr 71, pp 159-164

Abstract: Twenty-five amino acids were studied as the single source of nitrogen required for growth of highly toxic Dendrochium toxicum str. 5,800, Fusarium sporotrichiella str. 319 and Stachybotrys alterans str. 12694. Only some amino acids studied compared to potassium nitrate as the sole source of nitrogen required for growth. Most of them could be utilized to some extent, while the sulfur-containing amino acids inhibited considerably growth of the strains studied. It is believed that all these strains have a well developed enzyme system which is utilized in synthesis of all the amino acids that they need, since the growth of mycelium on the nitrate medium was by far the greatest. Amino acids affected considerably the synthesis of toxic substances: in case of D. toxicum a much higher toxicity (as compared to the toxicity with KNO_3) was observed with the following amino acids: Threonine, serine, proline, ornithine, tyrosine, and β -phenyl- β -alanine. With F.

"Yalan -- New Herbicide for Control of Echinochloa Weeds in Rice Plantings
and Wild Oats in Wheat Plantings"

V sb. Khim. sredstva zashchity rast. (Chemical Plant Protectants -- collection
of works), Vyp 1, Moscow, 1970, pp 174-179 (from PZh-Khimiya, No 13, 10 Jul 72,
Abstract No 13N518 by T. A. Belyayeva)

Translation: Yalan (I) is a highly effective soil herbicide for the control
of millet weeds in rice plantings. Tests have been made of a 60-percent
emulsion concentrate and a 10% granulated preparation of I. The herbicidal
action of I in the soil persists for 50-100 days. Before rice is planted,
I is applied and worked in by harrow in doses of 2-6 kg/ha. For wild-oat
control, I is applied in doses of 3-6 kg/ha before wheat is planted.

"State of the Blood Coagulation System in Burn Sickness"

Moscow, Sovetskaya Meditsina, No 5, 1972, pp 110-114

Abstract: To study blood coagulation during burn sickness, the blood of 60 patients in varying stages of the illness was investigated. The toxemia phase was characterized by an isolated decline in fibrinolytic activity and a rise in coagulating fibrinogen B level. Normal activity of free heparin, prothrombin index and, in 50 percent of the cases, the Lorand fibrin stabilizing factor were noted. Patients in the septic-toxemic phase showed further depression of fibrinolysis and a higher quantity of fibrinogen B, again with normal levels of heparin, prothrombin index and blood fibrinase. The action in these phases may be considered a defense mechanism of the body to protect fibrinogen from the disintegration which all proteins are subject to in burn sickness. Six persons with thrombotic complications had hypercoagulation with a lowered level of fibrinolysis, raised level of coagulating fibrinogen B, lowering of heparin and activation of the fibrin stabilizing factor. Ten 1/2

V sb. Ionoobmen. materialy v nauke i tekhn. (Ion Exchange Materials in Science and Technology--collection of works), Moscow, 1969, pp 102-107 (from RZh-Khimiya, No 1(II), 10 Jan 70, Abstract No 1 I270)

Translation: Electroconductivity (\bar{X}) and transport number (t_i) were studied in heterogenous mechanisms in Na_2SO_4 and MgSO_4 solutions in different concentrations. It is shown that t_i and \bar{X} are determined, first of all, by properties of the counterion (C_i). The greater its affinity to ionogenic groups, the lower the mobility of the C_i in the ion-exchange resin and the lower the values of t_i and \bar{X} . The nonexchange absorption of the electrolyte is simultaneously increased, which explains the established dependence of t_i and \bar{X} on the concentration of the external solution: as the valency of the C_i increases, the effect of this factor grows.

"Acute Intoxication with Chlorophos (Dipterex)"

Kazan', Kazanskiy Meditsinskiy Zhurnal, No 1, Jan/Feb 70, pp 37-40

Abstract: Chlorophos is a toxic agent whether inhaled, taken orally, or absorbed through skin. Only initial symptoms are different, depending on the route of entry. Most of the symptoms are suggestive of cholinergic pathology. Chlorophos may circulate in blood for up to five days, and is excreted from the body for 10-15 days, so purging of the gastrointestinal tract, dialysis, blood transfusions, and forced diuresis should be maintained for several days. Since in basic medium chlorophos converts to toxic dimethyl-2,2-dichlorovinyl phosphate, acidic oxidative agents should be used as a rule. The following agents are recommended for treatment of chlorophos poisoning: IV injections of dipyridoxine solution and purified cholinesterase, atropine injections every 20-30 min to the point of overatropinization.

"Angular Distribution of Star Tracks Formed by π -Mesons Having an Energy of
60 GeV on Heavy Nuclei of a Photoemulsion"

Moscow, Yadernaya Fizika, Vol 13, No 6, Jun 71, pp 1267-1269

Abstract: The authors study the angular distributions of thin, gray, and black tracks in spallations formed by Ag and Br π -mesons having an energy of 60 GeV. The distributions obtained are compared with the angular distributions of star tracks formed by protons having an energy of 2.26 and 19.5 GeV. The investigation involved 170 stars formed by the interaction with heavy nuclei of an ion photoemulsion having an energy of 60 GeV. With the aid of schematics the authors depict the angular distribution of the thin and gray tracks of these spallations. They find that the angular characteristics of the gray tracks are independent of energy and nature of the primary particle. The research is supported by equations as well as the tables and figures. The article contains two tables, two figures, and a bibliography of two titles.

Cyclic Axial Loading in the Elastic-Plastic Region"

V sb. Dinamika splosh. sredy. Vyp. 8 (Dynamics of a Continous Medium.
No. 8 -- Collection of Works), Novosibirsk, 1971, pp. 144-151 (from RZh-
Mekhanika, No 8, Aug 72, Abstract No 8V361)

Translation: The strength of a tube with a transverse cross section in the
form of a rectangular trapezoid welded at the ends to fixed rigid parts
under a cyclic temperature effect was studied. Experiments were made on
the object itself and on models, reduced tubes of rectangular cross section.
The tube was subjected to a variable load and cooling up to given tempera-
tures. The models were deformed without changing the temperature, com-
pression was achieved up to a given deformation, and stretching was achieved
up to a given value of the axial force. The material for the tube and the
models was Kh18N10T steel. Test results based on 100 cycles are discussed.
Stability losses in the walls and limited growth of deformation under the
first cycles are noted. The test ended with the formation of cracks in some
cases. D. A. Gokhfeld.

"Mechanical Protection From Mosquito Bites by Means of Specially Woven Cloth"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 39, No 4,
Jul/Aug 70, pp 458-462

Abstract: Jackets were made of cotton cloth with pore openings no more than 0.05 to 0.08 mm in diameter on the assumption that such openings would be too small to permit penetration of the mosquito's proboscis. Laboratory tests (insertion of an arm in a sleeve made from the cloth into a box containing mosquitoes) and field trials (wearing of the jackets by workers during the summer) showed that the material provided 100% protection against mosquitoes without irritating the skin. The cloth is wear- and tear-resistant, light, and launders well.

Elektron. tekhnika. Nauchno-tekhn. sb. Poluprovodn. pribory (Electronic Technology. Scientific-Technical Collection. Semiconductor Devices), 1969, Issue 7(50), pp 53-60 (from RZh--Elektronika i yeye primeheniya, No 1, January 1971, Abstract No 1B280)

Translation: A method is presented for obtaining synchronous (in space) measured photo- and electropotentials, the intensities of photo- and electroluminescence, and also the spectra of photo- and electroluminescence at slanting microsections of p-n junctions of GaAs. p-n and p⁺-p-n structures were revealed, with photoluminescence both in the p- and in the n-type. The minimum photoluminescence is obtained in the space charge layer because of separation of the carriers by the junction field. It is determined that the optimum concentration of Zn for luminescence is equal to 8 . 10¹⁸ - 1.5 . 10¹⁹ cm⁻³. 5 ill. 14 ref. Summary.

VERONIN, V. G., et al, V sb. Fiz. elektronno-dyrochn. perekhodov i poluprovodn. priborov (Zh. "Fiz i tekhn. poluprovodnikov", "Nauka," 1969, pp 12-16 (from RZh-Elektronika i yeye primeneniye, No 4, Apr 70, Abstract No 43294)

emits light, and to evaluate the electrophysical and optical parameters of this region (absorption coefficient, diffusion length, lifetime). As applied to diffused p-n junctions on a GaAs basis which emit infrared emission, it is shown that the emission is primarily emitted by the p-region adjacent to the space charge region of a p-n junction. The absorption coefficient of this region for recombination emission of p-n junctions in GaAs proved to be equal to 700 cm^{-1} , the diffusion length of the electrons $4-6 \text{ microns}$, and the lifetime of the electrons in the p-region $1.5 \cdot 10^{-8} - 3.5 \cdot 10^8 \text{ sec}$. 3 ill. 4 ref. "Phosphinic Acids as Bifunctional Catalysts in the Formation of Amide Bonds"
Moscow, Doklady Akademii Nauk SSSR, Vol 202, No 5, Feb 72, pp 1127-1130

Abstract: Phosphinic acids may exhibit a bifunctional type of catalytic activity, analogously to carboxylic acids. This possibility was studied on the model of acylation of m-chloroaniline with acetic anhydride in benzene at 25°C. It was shown that in small quantities phosphinic acids substantially accelerated the reaction rate. Monofunctional compounds, such as m-nitrophenol, had no effect on the reaction. Quantitative comparisons have shown that phosphinic acids are as active as the carboxylic acids; their catalytic activity increases with increasing acidity. The catalytic activity of phosphinic acids is based on their ability to form cyclic transition complexes with amines which decompose into the final reaction products -- the amides and carboxylic acids.

"The Effect of the Temperature Fluctuation on the Homogeneity
of Single Crystals Grown From Melt"

Moscow, Tsvetnyye Metally, No 4, Apr 72, pp 54-55

Abstract: An experimental study was made of the effect of changes of the melt temperature in the interval from 0.025 to 10 °C on properties of gallium arsenide single crystals grown by the method of directed horizontal crystallization. It is demonstrated that the spectrum of disturbances is sufficiently wide, but a basic frequency with a ~15 sec period and a ~0.25 °C amplitude emanates and the fluctuation disturbances affect the heterogeneity of the material. The effect of compulsory periodic perturbations, with amplitudes from 0.5 to 2 °C and periods from 2 to 40 min was investigated. On the basis of experimental data, the requirements were formulated for a system with automatic control of the process of directed horizontal crystallization. Two illustr., four biblio. refs.

"Combined Effects of Carbon Monoxide and Ionizing Radiation in a Chronic
Experiment".

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 5, 1971, pp 36-38

Abstract: Exposure of rats to carbon monoxide (0.012 mg/L) for 85 days inhibited the animals' growth, increased their resistance to hypoxia, and decreased the weight of the lungs and liver. Exposure of other rats to the same amount of CO and ionizing radiation (0.05 rem/day) for the same length of time had no effect on the animals' growth or resistance to hypoxia, but it decreased the weight not only of the lungs and liver but of the testes as well. In a second experiment, exposure of rats to ionizing radiation but at a lower dose of CO (0.005 mg/L) did not have any specific adverse effects, for in hematologic, biochemical, and morphologic respects the experimental animals virtually indistinguishable from the controls.

"The Causes of Differences in Carbon Monoxide Concentration in Exhaled Air
in Man".

Leningrad, Fiziologicheskiy Zhurnal SSSR imeni I. M. Sechenov, Vol 58, No 11,
1972, pp 1756-1759

Abstract: In man, carbon monoxide concentration in exhaled air normally varies from 2.8 to 25 mg/m³. It increases with increasing erythrocyte concentration. For example, when erythrocyte concentration is 4.71 million/mm³, the average CO concentration is 9.6 mg/m³ of exhaled air, and when the RBC count is 5.34 million/mm³, CO concentration is 22.9 mg/m³. On the other hand, the concentration of catalase in the erythrocytes decreases with increasing hemoglobin concentration in blood; and with decreasing catalase, hemoglobin catabolism increases. The CO molecule is formed through incomplete oxidation of the carbon atom in the alphamethylene bridge in the tetrapyrrole ring. Thus, CO production is proportional to hemoglobin catabolism, and it increases in hemolysis. Since 1.27 units of CO are produced for one equivalent unit of hemoglobin catabolized, other hem-containing compounds, such as myoglobin and 1/2

EFFECT OF FREON-11482 ON THE ACTIVITY OF ISOENZYMES OF LACTATE DEHYDROGENASE

(Article by A. I. Tunov, V. A. Voznyuk, A. A. Postnikov, I. A. Linnichenko,

and T. N. Kudryavtseva, Scientific Research Institute of Hygiene and Epidemiology, Institute of Industrial Hygiene, Russian Academy of Medical Sciences, Moscow, Vol. 5, No. 5, September-October 1972, pp. 87-89, submitted for publication

16 December 1971)

UDC 577.156.367.01.06

The literature contains information on the possibility of atmospheric contamination of closed spaces by chemical substances emanating from ultraviolet lamps, technical apparatus and different systems (Klemmedson, V. V. Rusakov, and L. A. Tunov; Slager). In particular, the attention of researchers has been drawn to the study of freons. For example, the presence of freon-11482 in the air of American spaceships has been noted by Wessels, Steampier, Anderson and Sanders. It is emphasized that upon contact with heated surfaces, the freons decompose, forming hydrogen chloride and fluoride and traces of phosphine (G. A. Terrel, Son and H. A. Masten; Russell; Wessels).

The biological effect of freon-11482 and the products of its decomposition is a likely problem.

A. I. Korbaeva, et al., have studied by B. D. Karpov (Korbaeva), taking into account that the narcotic effect, presence of a narcotic and hypoxia and accumulation of lactic acid in cerebral tissues (A. I. Khaykin), in the case of intoxication by freon-11482, can be accompanied by specific changes in lactate dehydrogenase activity (G. V. Palladin and O. G. Detoliashvili and Dendestad).

Cations by carbon monoxide (L. A. Tunov and V. V. Kudryavtseva) and lead (Quattrini and Gotoh). A change in the isoenzymes of lactate dehydrogenase has been described during hypoxia caused by an oxygen shortage (Yu. A. Kurnov) and in poisoning by styrene (Klein, et al.).

"Controlling the Generation Kinetics of Coupled Lasers"

Kiev, Ukrainskiy Fizicheskiy Zhurnal, Vol 17, No 4, Apr 72, pp 628-634

Abstract: The article suggests a method for obtaining strictly stationary generation of one of the coupled lasers by means of the second (initiating) laser, which is adjusted so that in the absence of coupling it generates under almost stationary conditions with small oscillations (this can be achieved, for example, by introducing a KS-15 negatively modulating filter into the initiating laser cavity). Theoretical calculations indicate that in order to obtain stationary generation throughout the pump pulse it is sufficient for the coupling coefficient to be of the order of 1 percent. There were two series of experiments, with the first studying the dependence of the generation kinetics on the coupling coefficient γ . Two ruby lasers with a system of two positive lenses were used. It was found that at $\gamma = 0$ the radiation of the investigated laser represented the regular damped intensity

1/2

No 4, Apr 72, pp 628-634

oscillations typical of the free generation of lasers with a lens system. There is an increase in the rate of damping of intensity peaks with an increase in γ . Finally, at $\gamma = 1.1$ percent relaxation occurs practically instantaneously, and the generator operates under purely quasistationary conditions. The second series of experiments studied the dependence of the generation kinetics on the pump power.

The authors thank A. M. RATHER and YU. V. NAEVOYIN for useful discussion of the results.

TACHOOSCILOGRAPHIC CHANGES IN PATIENTS WITH ARTERIAL
HYPOTENSION UNDER THE EFFECT OF TURPENTINE BATHS

O. P. Tsvilova (Kiev)

The efficiency of turpentine baths (white emulsion) has been studied in patients with arterial hypotension as judged by tachoscillographic data. The clinical improvement was accompanied by favourable functional changes of many tachoscillographic indices. It is concluded that white turpentine baths may be considered a means furthering normalization of the arterial pressure in patients with arterial hypotension.

"Exercise Tests With Recording of the Electrocardiogram"
Moscow, Voyenno-Meditsinskiy Zhurnal, No 8, 1972, pp 68-71

Abstract: A series of interrelated functional tests was carried out directly in an aviation unit in order to determine the continued fitness of personnel for flight duty. Following a general physical examination, EKG taken at rest, blood and urinalyses, the men perform a double Master's test with the EKG recorded using 12 leads immediately afterward and 2, 4, 6, and 10 minutes later. If an examination of the EKG reveals no contraindications, the men take the glucose test at basal metabolism, with the EKG again recorded with 12 leads. If the results are satisfactory, the airmen are exposed to hypoxia the next day or day thereafter in a pressure chamber ("altitude" of 5000 m) where the EKG is recorded at minutes 1, 7 to 10, and 30 and after the men leave the chamber. Contraindications for taking the exercise tests are pain in the heart even in the absence of EKG pathology, ambiguous EKG changes, presence of cardiovascular disease, disturbance of fat metabolism or tendency to put on weight quickly, decreased work capacity, unexplained fatigue, and persistent tachycardia. The described tests are useful in detecting latent coronary pathology.

"MHD Drives for Pumping of Liquid Magnesium"

MGD v Metallurgii i Liteyn. Proiz-ve [MHD in Metallurgy and Foundry Production -- Collection of Works], Kiev, 1972, pp 126-130. (Translated from Referativnyy Zhurnal Metallurgiya, No 8, 1973, Abstract No 8G202, by G. Svodtseva).

Translation: The Tallin Polytechnical Institute has developed and introduced to metallurgical production several induction MHD drives for feeding liquid Mg from a continuous refining furnace to a casting conveyor. The basic technical data are presented on the MHD drives and a schematic diagram of the power portions is presented. The drives operate under manual control. During tapping, the static head and hydraulic resistance are increased. This means that conservation of constant productivity requires that the supply voltage be increased by 1.2-1.8 times. The channel of the pump is replaced every three to five days. A diagram of the activity of the MHD drive under manual control is presented.

"One Modification of a Correlation Graph"

Tr. Vychisl. Tsentra. Tartus. Un-t [Works of Computer Center of Tartu University], 1972, No 26, pp 19-34. (Translated from Referativnyy Zhurnal Kibernetika, No 4, 1973, Abstract No 4V237, by S. Ayvazyan).

Translation: A certain modification is presented for the so-called method of correlation pleiads, allowing a fixed set of numerical characteristics to be divided into groups, within which the characteristics are rather highly mutually correlated. The author believes that his modification allows certain shortcomings of the method to be avoided. It is suggested that the method be used in combination with other methods of reduction of dimensionality, in particular as a preliminary stage in application of a model of factor analysis.

"Set of Statistical Methods of Classification (pattern recognition)"

Tr. Vychisl. Tsentr. Tartu. Univ. [Works of Computer Center of Tartu University], 1972, No 25, pp 3-38 (Translated from Referativnyy Zhurnal, Kibernetika, No 3, Moscow, 1973, Abstract No 3 V701 by V. Mikheyev).

Translation: A set of statistical methods of classification (grouping, cluster analysis, taxonomy), i.e., stochastic methods of pattern recognition without a teacher, is studied. No assumptions are made and no limitations are placed on the discriminating functions. In some particular cases, it is assumed that the discriminating functions are linear, piecewise-linear or parabolic. It is noted that the methods studied allow a priori information on the type of distribution of the initial random quantities to be used, but also operate without this a priori information. The initial characteristics may be quantitative, ordinal or qualitative. The number of groups may be precisely or approximately fixed, but the number of groups may also be selected to the most suitable for a given material in some sense. The iterative process studied is a certain variation (generalization) of "Forel"-type methods with variable parameters and forms of groups ("taxons"), for which statistical determina-
1/2

TIYT, E. A., Tr. Vichisl. Tsentr. Tartus. Un-t., 1972, No 25, pp 3-38.

tion of the number of items in the group is also possible in refining the groups. Using the methods studied, a number of adjacent problems can also be solved: comparison of two (or more) different groups for purposes of selection of the best groups; comparison of two groups from the stand-point of their coincidence (whether both methods describe the same groups or not); determination of typical group elements; combination of new elements in available groups; grouping of elements for which not all characteristics are known; selection of an informative subspace in the space of characteristics; addition of new material to already available groups.

In order to evaluate the functional and adaptive capabilities of the body it is now customary to use different kinds of space flight (approximate form simulating accelerations or space flight hypotension), isolation, change in diurnal rhythm, etc.). Study of the influence of those factors on the dynamics of the body adaptation factor, most frequently accomplished with but exposure to a single

In order to ascertain the capability of the body to withstand the influence of the nervous, circulovascular, endocrinological and other systems during a long-term stay in space flight, a study was made of the body functions to prolonged tolerance and well-being of the nervous, circulovascular, endocrinological, immunological and other systems during a 10-day experiment. Immuno-biological data: two days -- restructuring of the body; four-hour cycles of work, rest and sleep; collecting, analysis period; twelve days -- study of the rhythm with days -- study of the after-effect (eleven days -- restructuring of the diurnal rhythm there was a 48-hour group); during the first two days of three subjects (first group); during the last two days of hypotension and another person. During the period of 12-day hypotension there was a 48-hour functioning of the experiment we detected definite changes in the autonomic reflexes, manifested in a liability of

THERMOTROPIGRAPHY OF THE SKIN IN HEALTHY HUMAN SUBJECTS UNDER CHRONICALLY
CONDITIONS

Article by A. Ya. Tsvetkov, S. S. Kostylev, E. V. Shirokova, E. V. Davidenkova, L. I. Rusanetskiy
 Uralian, Vol. 3, No. 1, pp. 69-72, submitted for publication 17 September 1971.

Abstract: Over a 12-month period the temperature of the human skin (thermotropography) was measured at ten symmetric points (forehead, back of hand, stomach, cheek, neck, chest, shoulder, back of the foot) in 150 healthy male subjects. In the age group 24-35 under seasonal variations the test subjects were divided into two groups: in the first (55 persons) measurements were made during the warm season (temperature measured and in the second group (95 persons) during the "normal" (October to March). The statistical variation in skin temperature (thermotropography) for every area of the human body indicates that the most thermostable areas are the neck, chest, stomach and proximal parts of the limbs and cheeks. The latter areas exhibited distinct regional variations with respect to the determinants of mean ("central") skin thermotropography. The authors can be used together with clinical data in studying autonomic-vascular regulation and thermal regulation during body exposure to various stress factors.

One of the principal conditions for normal vital functioning in man and higher animals is a constancy of body temperature (homeostasis), ensured by the functioning of special heat-regulating mechanisms, especially.

According to data from a number of authors (I. S. Uzynberg; I. I. Rusanetskiy; L. Ya. Sharangorodskiy; Ye. P. Davidenkova-Kulikova; Ye. E. Drigo

"Some Problems in Automating Experimental Investigations of the Parameters of Analog-Digital and Digital-Analog Converters"

Novosibirsk, Konf. po avtomatiz. nauch. issled. na osnove primeneniya EVM,
1972--sbornik (Conference on Automating Computer-Based Scientific Research,
1972--collection of works), 1972, pp 97-101 (from RZh-Avtomatika, Teleme-
khanika i Vychislitel'naya Tekhnika, No 11, Nov 72, abstract No 11B302)

Translation: It is noted that most parameters of converters are functions
of random quantities, and therefore their determination requires statistical
methods which can be completely realized only when fully automated systems
are used. The particulars and principles of organization of automated
systems for measuring parameters are considered. Bibliography of five
titles. L. P.

COMBAT ACTION OF A MOTORIZED RIFLE BATTALION IN A CITY
[Excerpts from book by Maj Gen A. E. Shovkunovitch, Col F.I. Tomson, and Col

S.I. Tschch; Novosibirsk: Sovetskoye Knizhnoe Izdatelstvo Stril'ca V. Gorbachev, 1972, signed co-prefs 30 March 1971, 182 ppj,

Polyvye Dnystryu Motorized Rifle Battalion in a City] v Gorode (Combat Action of a Motorized Rifle Battalion in a City)

Published to Press: 30 March 1971. Number of Series: 800.

Brief Description

of distinguishing aspects of organization, deployment, and defensive combat in a city when either nuclear-armed by subunits for conventional weapons are employed.

The concrete tactical examples of practical work of the commandants of a motorized rifle battalion in controlling for offensive and defensive combat to demonstrate the commander's theoretical questions as well as the practice of

gaining in the Great Patriotic War described based on the practical work of a unit in foreign armies and particular troop exercises.

The book is intended in the open foreign press, as described in the book, as an aid in preparing for use by officers in motorized rifle units.

"Organization of an Input-Output System With Inquiry and Response Stations
and a VNIIEM-3 Computer for Real-Time Collection of Production Data"

V sb. Primeneniye vychisl. tekhn. v elektrrotekhn. prom-sti (Use of Computer Technology in the Electrical Engineering Industry--collection of works), Moscow, 1971, pp 289-294 (from RZh-Kibernetika, No 11, Nov 71, Abstract No 11V844)

Translation: The authors discuss an input-output system with inquiry-response stations. The system is a software element in a system for collection of production data in a slab mill. The described system organizes bilateral communications between the VNIIEM-3 control computer and telegraph equipment installed in the production line, and implements series-parallel reception of messages and output of information in the VNIIEM-3 computer system in amounts up to eight pieces, as well as quasimultaneous operation of the computer and an external device. "Distillation Desalination Units for Purification of Sewage From Some Industries"

Moscow, Vodosnabzheniye i Sanitarnaya Tekhnika, No 7, 1973, pp 17-21

Abstract: The problems involved in purification of sewage with high salt content are discussed including the aspects of their dumping into the general water works, recycling, etc. Purification units have been designed based on evaporation of sewage. Technical diagrams for the apparatus used in thermal purification are reported. None of them are in use as yet. Some are being built at present time, some are still on the drawing boards.
